

PROJECT SUMMARY, WITH MILESTONES – AI GLOBAL MOBILITY ENGINE

The development of the JandZ AI* platform will follow a quality-first strategy focused on delivering a deeply intelligent, highly personalized, and trusted opportunity discovery experience from the outset. While the platform is intentionally designed on a low-cost, scalable architecture, the priority of the MVP is not simplicity alone, but the quality, depth, and usefulness of the AI-generated outputs. The goal is to build a system that users return to consistently because it materially improves their ability to discover, evaluate, and pursue global opportunities.

Milestone 1 will establish the platform's core intelligence infrastructure and user personalization system. JandZ AI will operate primarily through WhatsApp, with a complementary web dashboard, and support both voice and text interactions. Users will create rich profiles containing educational background, professional experience, certifications, skills, geographic preferences, funding needs, and mobility goals, with optional CV upload and parsing functionality. The system will be designed to intelligently interpret user intent, identifying opportunity type, location preferences, funding constraints, sponsorship needs, and career direction rather than relying solely on keyword searches. At this stage, a normalized opportunity database structure will also be established to support jobs, scholarships, internships, grants, admissions, investments, and other mobility pathways.

Milestone 2 will focus on building a deep opportunity discovery and verification engine capable of sourcing high-quality global opportunities from multiple channels. Rather than depending heavily on expensive APIs, the platform will rely primarily on targeted scraping, lightweight search orchestration, and direct retrieval from high-signal sources such as company ATS systems, government immigration programs, universities, scholarship portals, foundations, development agencies, and curated social media signals. The platform will aggressively filter and refine search results to prioritize opportunities that explicitly support international applicants, visa sponsorship, funding accessibility, or African talent mobility. A strong credibility and verification layer will rank opportunities according to source reliability, legitimacy, and relevance, while duplicate detection and noise reduction systems will ensure outputs remain clean, trustworthy, and actionable.

Milestones 3 will deliver the platform's advanced intelligence and personalization capabilities. Opportunities retrieved from the discovery engine will be scored and ranked against each user's profile using a sophisticated matching system that considers education, experience, geographic compatibility, funding fit, competitiveness, and sponsorship eligibility. The AI layer will then generate tailored application guidance for each user, including application strategy, CV recommendations, eligibility analysis, scholarship positioning, and personalized improvement suggestions. The system will also enrich opportunities with actionable information such as hiring manager contacts, admissions offices, recruiter details, or grant administrator emails where publicly available. A preliminary success prediction engine – initially heuristic-based, will estimate the strength of a user's fit for specific opportunities and evolve over time into a more advanced machine learning system as platform data grows.

The final **Milestone 4** of the MVP will focus on engagement, retention, and continuous learning. Users will receive intelligent WhatsApp and dashboard alerts for approaching deadlines, newly matched opportunities, profile improvement suggestions, and other relevant updates. The platform will allow users to save opportunities, track applications, and record outcomes such as interviews, admissions, or funding awards. A feedback and analytics loop will continuously capture user engagement signals and real-world outcomes, enabling administrators to monitor search trends, opportunity performance, geographic demand, and

system accuracy through an internal dashboard. Over time, this feedback loop will improve recommendation quality and strengthen the platform's proprietary mobility intelligence dataset.

Overall, the MVP is intended to function not merely as an opportunity aggregator, but as a high-trust AI mobility intelligence system that combines deep search, personalization, verification, and actionable guidance into a unified experience for globally mobile talent.

***JandZ AI** *is a temporary name for the AI mobility system and be changed during development. To be confirmed after Milestone 2*
